

A Paper-Layout Preview for Scientific Plots

Example Research Group

Abstract

This compact mockup shows how the repository’s vector plots look after insertion into a conventional two-column paper. It includes a regular single-column figure and a full-width figure spanning both columns.

Figure 1. A single-column figure with two related learning curves. The subfigures are sized against the actual column width rather than an arbitrary slide canvas.

Table 1. Example training configuration.

Optimizer	AdamW
Batch size	128
Warmup steps	800
Evaluation interval	400 steps

1 Overview

Scientific figures are usually judged at their final publication size rather than at the size used during editing. Figure 1 shows a typical single-column comparison: two related plots share one caption while each subfigure keeps its own local label. The text remains readable at the column width, and the axes do not compete with the caption.

2 Experimental setting

The mockup uses the same PDF assets that are linked in the repository README. Because the source files are vector PDFs, line weights and labels remain sharp when the figure is magnified. In practice, this is the point at which overly small tick labels, long legends, or excessive whitespace become visible.

Table 1 gives the kind of compact context that normally appears next to a figure in a methods or experiments section.

The full-width layout in Figure 2 is useful when four panels need to be compared together. It also makes the trade-off explicit: the panels receive more horizontal space, but the figure consumes the full page width and should therefore carry one focused caption rather than several independent explanations.

Figure 2. A full-width four-panel figure suitable for a paper’s training analysis section. The panels share a common visual language while each remains legible at the final two-column width.
